## Course info

Course website: <https://cvl-umass.github.io/intro-cv-spring-2025>

Read the course logistics and lectures

COMPSCI 370

logistics lectures

This course will cover the fundamentals of teaching computers to "see" like humans. Topics to be explored include the design of cameras, image representation in computers, light and color perception, detecting lines and corners in images, estimating optical flow and alignment between image pairs, and developing algorithms for visual pattern recognition. Advanced topics may also be covered if time permits. The course schedule can be found on the lectures page.

The course will emphasize mathematical foundations rather than relying on software packages. A strong background in mathematics, including probability, statistics, calculus, linear algebra, and programming, is required. Familiarity with Python is helpful but not mandatory, as students will receive Python programming instruction during the course. The official prerequisites for the course are a grade of 'C' or better in CMPSCI 240 or CMPSCI 383. Additional course information, including expectations and policies, can be found on the logistics page.

- Time: Tuesday/Thursday 11:30AM – 12:45PM
- Location: LGRC, A301
- Discussion: Piazza
- Homework: Piazza
- Lecture recordings: Canvas
- Contact: Students should ask all course-related questions on Piazza, where you will also find announcements. For external inquiries, personal matters, or in emergencies, you can email the Instructor.

A screenshot of the Canvas course page for COMPSCI 370. It shows the course title "Intro to Computer Vision COMPSCI 370 (160552) SP25", the syllabus link, and a detailed description of the course content. The description includes a brief overview of the course, its goals, and the mathematical foundations it covers. It also mentions the use of Python for programming and the availability of lecture recordings on Canvas.

- Required Background
- Grading
- Course policies
- Accommodation Statement
- Acknowledgements

## Textbooks

The primary material for the class are lectures and readings listed on the lectures page. There is no required textbook for this class. Nevertheless, the following textbooks might be useful, even though they are aimed at a graduate audience.

- Computer Vision: A Modern Approach by David Forsyth and Jean Ponce (2nd ed.)
- Computer Vision: Algorithms and Applications, by Richard Szeliski (2nd ed.) (available online).

We will post links to sections of Szeliski's book for each lecture. These readings are not required, but they might be helpful especially if you want to dig deeper into specific topics.

5

## Requirements and grading

Homework: **45%**

- 5 in total
- Completed individually (use of AI not permitted)
- Roughly every two weeks

Midterm: **20%** (3/13 LGRC A301 — same room as the class, during class hours)

Final: **30%** (5/14 1-3pm, LGRC A301 — also the same room as the class, but different time)

Class participation: **5%**

- In-class activities — low-stakes quizzes throughout the semester
- Echo 360:
  - Will available within a few hours
  - Unreliable — fails 10% of the time

COMPSCI 370

Subhransu Maji — UMass Amherst, Spring 25

6

## Who should take this course?

Do you have all the pre-requisites?

- Math — good understanding of calculus, linear algebra and probability
- Programming — ability to program in Python

Teaching style

- Slides, notes, tutorials
- Optional readings — papers, articles, references to books

Still not sure?

- Email / drop by office hours for a chat

Waitlisted?

- Will decide on a case by case basis (mostly limited by space)

COMPSCI 370

Subhransu Maji — UMass Amherst, Spring 25

## Course background

What is the course about?

- Physics and geometry of image formation
- Finding and exploiting patterns in visual data
- It is hard, ad-hoc — few theorems, but we rely on those from other areas

Why study vision?

- You are in good company: Euclid, Alhazen, da Vinci, Kepler, Galileo, Descartes, Newton, Huygens, Maxwell, Helmholtz, Mach, Herring, Cajal, Minkowski, Hubel, Wiesel, Wald
- Broad applicability: robotics, astronomy, ecology, medicine
- Open area, lots of room for new work

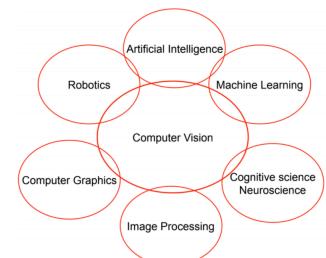

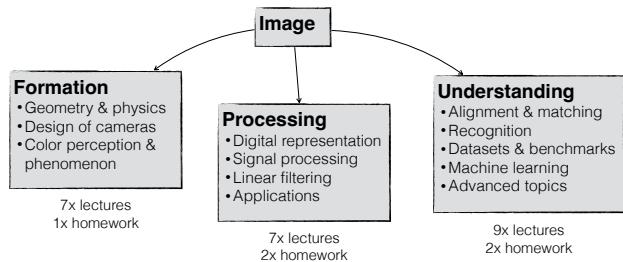

Figure credit: Kristen Grauman

COMPSCI 370

Subhransu Maji — UMass Amherst, Spring 25

8

## Topics covered

Not a zoo tour!

Not an introduction to tools!

You will learn how these techniques work and how to implement them

COMPSCI 370

Subhransu Maji — UMass Amherst, Spring 25

9

Now, on to some **real** content ...

(but first, questions?)

11

## Course goals

By the end of the semester, you should be able to:

- Look at a problem and identify if CV is an appropriate solution
- If so, identify what types of algorithms might be applicable
- Apply those algorithms, conquer the world
- Consider taking other courses in AI

In order to get there, you will need to:

- Do a lot of math (calculus, linear algebra, probability)
- Do a fair amount of programming
- Work hard (this is a 3-unit course)

COMPSCI 370

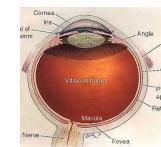

Subhransu Maji — UMass Amherst, Spring 25

10

## Why vision? Light!

It is how we see other people, navigate our environment, communicate ideas, entertain, and **measure** the world around us.

COMPSCI 370

Subhransu Maji — UMass Amherst, Spring 25

Source: A. Berg

12

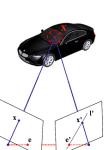

## Why is light good for measurement?

Microscopy

Surveillance

3D Analysis / Navigation

Remote  
Sensing

- Plentiful, sometimes free
- Interacts with many things, but not too many
- Goes generally straight over distance
- Very small → high spatial resolution
- Fast, but not too fast → time of flight sensors
- Easy to detect → cameras work, are cheap

## Human vision

Amazingly good, fast and accurate

Large amount of the brain seems to be for processing visual data

Vision is difficult!

### LETTERS TO NATURE

#### Speed of processing in the human visual system

Simon Thorpe, Denis Fize & Catherine Marlot

Centre de Recherche Cerveau & Cognition, UMR 5549, 31062 Toulouse, France

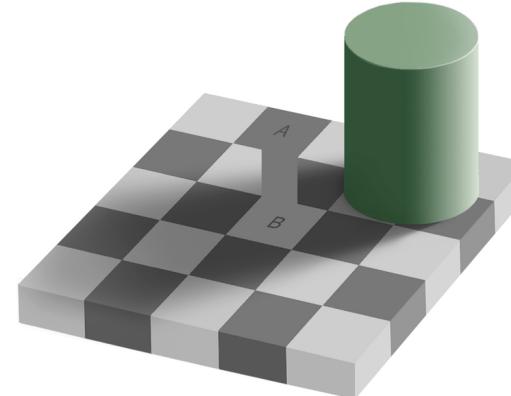

How long does it take for the human visual system to process a complex natural image? Subjectively, recognition of familiar objects and scenes appears to be virtually instantaneous, but measuring this processing time experimentally has proved difficult. Three main measures have been reported in the literature, but these include not only visual processing but also the time required for response execution. However, event-related potentials (ERPs) can sometimes reveal signs of neural processing well before the motor output'. Here we use a go/no-go categorization task, in which subjects were asked whether a presented photograph, flashed on for just 20 ms, contained an animal. ERP analysis revealed a frontal negativity specific to no-go trials that develops roughly 150 ms after stimulus onset. We conclude that the visual processing needed to perform this highly demanding task can be achieved in under 150 ms.

[Neurophysiological measurements of the latencies of selective

such a task (the subjects had *no a priori* information about the type of animal to look for, its position or size, or even the number of animals present), performance was remarkably good. The average proportion of correct responses was 94%, with one of the fifteen subjects achieving 98% correct responses. The median reaction time on 'go' trials was 145 ms, although individual times varied considerably between subjects, from a minimum of 382 ms to as much as 567 ms (Fig. 1). This remarkable level of performance was possible despite the very brief presentations, which effectively rule out the use of eye movements during image presentation.

Given the behavioural reaction times, an upper limit on the time required for visual processing, the analysis of event-related potentials provided a much stronger constraint. By comparing average brain potentials generated on correct 'go' trials with those generated on correct 'no-go' trials, we were able to demonstrate that the two potentials diverge very shortly after ~150 ms after stimulus onset. The effect was particularly clear at frontal recording sites, and was characterized by a nearly linear increase in the voltage difference over the following 50 ms or so, the period before the go/no-go decision (Fig. 2). In 21 of 25 subjects, we saw the effect (Fig. 3), and although the onset latency varied somewhat between subjects, the differences were very minor compared with the very large differences in behavioural reaction times. Furthermore, there was no correlation whatsoever between behavioural reaction time and the onset latency for the differential response. This makes it unlikely that the differential

### Google AI Blog

The latest news from Google AI

#### Announcing the 7th Fine-Grained Visual Categorization Workshop

Wednesday, May 20, 2020

Posted by Christine Kaiser Chen, Software Engineer and Serge Belongie, Visiting Faculty, Google Research

Fine-grained visual categorization refers to the problem of distinguishing between images of closely related entities, e.g., a monarch butterfly (*Danaus plexippus*) from a viceroy (*Limenitis archippus*). At the time of the first FGVC workshop in 2011, very few fine-grained datasets existed, and the ones that were available (e.g., the *CUB* dataset of 200 bird species, launched at the workshop) presented a significant challenge to the leading classification algorithms of the time. From 2011 to 2020, and the subsequent decade of rapid technological development, breathtaking changes. Deep learning based methods helped CUB-200-2011 accuracy rocket from 17% to 90%, and fine-grained datasets have proliferated, with data arriving from a diverse array of institutions, such as art museums, apparel retailers, and farms.

In order to help support even further progress in this field, we are excited to sponsor and co-organize the 7th Fine-Grained Visual Categorization (FGVC7), which will take place as a virtual gathering on June 19, 2020, in conjunction with the *IEEE Conference on Computer Vision and Pattern Recognition (CVPR)*. We're excited to highlight this year's world-class competition and research challenges, raise interest in the application to fashion attributes, and we invite computer vision researchers from across the world to participate in the workshop.
